

NetServer 3000™

► *NetServer systems reside at regional sites and distribution centers, where they manage the flow of information between the corporate data center and remote outlets.*

Cost-effective integration of geographically dispersed consumer businesses.

Integrating your business helps you cut operating costs and improve customer service. However, connecting a geographically dispersed network of outlets, regional offices, and distribution centers poses a complex connectivity problem. When you add the proliferation of multivendor systems found in most automated environments, unifying your business becomes a significant challenge.

Simpact's NetServer 3000 family of communications concentrators is the cost-effective solution. The NetServer family provides top-to-bottom integration of your nationwide, hierarchical network, connecting all devices, systems, and networking environments into a single, unified network.

Each NetServer system functions as a regional hub, concentrating and broadcasting data between the corporate data processing center and up to 80 geographically dispersed outlets. This two-way communication between the customer and your operation not only

helps you manage your business more efficiently, but it helps you better address your customers' needs.

The NetServer family is cost effective both today and tomorrow. The system's high line density minimizes your initial connectivity investment, and its line concentration capability minimizes your network operating costs. In addition, the NetServer system provides the cost-effective migration path you need for unlimited growth, allowing you to take advantage of new technologies while supporting the old.
